

Durham Region Health Department **Facts about...**

Human Papillomavirus (HPV) Vaccine

What is it?

Human Papillomavirus (HPV) vaccine protects against certain types of HPV that can cause cervical cancer, genital cancers, precancerous lesions, anal cancer, certain cancers of the head and neck, and genital warts. For more information, see [Facts About...Human Papillomavirus \(HPV\)](#).

There are two HPV vaccines that are approved for use in Canada:

- Gardasil[®]9 protects against nine types of HPV (6, 11, 16, 18, 31, 33, 45, 52, and 58) and is publicly funded (free) for people who are eligible.
- Cervarix[®] protects against two types of HPV (16 and 18) but is not publicly funded (free).

How effective is the vaccine?

The vaccines are highly effective in protecting against cancers and genital warts associated with HPV:

- All HPV vaccines can prevent approximately 70% of anogenital cancers and 60% of high-risk precancerous cervical lesions.
- Gardasil[®]9 provides further protection against 14% of anogenital cancers, 30% of high-risk precancerous cervical lesions and approximately 90% of genital warts.
- HPV vaccine produces a higher immune response during the preteen years than it does in older adolescents.
- The vaccine does not protect people who are already infected with HPV.

Who should get the vaccine?

Gardasil[®]9 is approved for females between 9 and 45 years of age, and males between 9 and 26 years of age. The following people are able to receive the **HPV vaccine for free**:

- Grade 7 and 8 students through the school-based immunization program.
- Male students (born in 2004) and female students in grade 9 to 12.
- Men who have sex with men under the high risk vaccine program.

The vaccine may be recommended for others at risk for the disease, however the vaccine would have to be purchased. Talk to your health care provider or check with your private health insurance if you are not eligible to receive the vaccine for free.

If you require this information in an accessible format, contact 1-800-841-2729.

What is the schedule for the vaccine?

- Gardasil®9 vaccine is routinely given to students 9 to 14 years of age as two doses, 6 months apart as part of the Grade 7 school-based immunization program.
- Those who receive the vaccine when they are 15 years of age or older get 3 doses: 0, 2 and 6 months apart.

Are there side effects with the vaccine?

- HPV vaccine is safe and well tolerated. Side effects are usually mild and last a short time.
- The most common side effects are redness, pain and swelling where the needle was given.
- If you think a serious reaction is developing, seek medical attention right away. Any unusual or significant changes in your health or your child's health after the immunization should be reported to a health care provider and the Health Department.

Who should **NOT** get the vaccine?

- If you have a severe allergy (anaphylaxis) to any previous vaccine(s) or to any part of the vaccine.
- Anyone **less than** 9 years of age.
- Pregnant women.

For more information on contents of the vaccine, refer to the [Canadian Immunization Guide, Evergreen Edition](#).

Don't forget to update your immunization record!

After you or your child receives a vaccine, update your immunization record (yellow card). For children in school or child care, call the Health Department to update your child's immunization records. Keep your records in a safe place.
