Poison Ivy

What is it?

Poison Ivy is a three leaved poisonous outdoor plant. The plant leaves contains an oily sap called *urshiol* that causes an allergic skin reaction.

How is it spread?

Direct contact with the plant can cause a skin rash. Objects that have been in contact with the plant may also carry the sap. Smoke from burning poison ivy may cause lung and skin reactions.

What do I look for?

Most people will develop an itchy red rash with bumps or blisters within a few days of contact with the sap. Oozing blisters are not contagious.

How is it treated?

A mild rash can be treated with cool cloths, a cool shower or lukewarm bath and antihistamines. Consult a health care provider if:

- Nothing soothes the rash
- The rash looks infected
- There is a fever
- The rash is on the face or genitals
- There is swelling on the face

How can I protect myself?

- Wash skin thoroughly with soap and cold running water after contact
