Hepatitis A Vaccine

What is it?

Hepatitis A vaccine protects against the hepatitis A virus which can cause damage to your liver. There are two vaccines that protect against hepatitis A; the hepatitis A vaccine and a combined hepatitis A and hepatitis B vaccine.

Who should receive the vaccine?

Hepatitis A vaccine is recommended for anyone who is more at risk for hepatitis A infection. The following people can get publicly funded (free) hepatitis A vaccine:

- persons with chronic liver disease (including hepatitis B and hepatitis C)
- persons who are intravenous or injection drug users
- men who have sex with men (MSM)

How effective is the vaccine?

Hepatitis A vaccine can provide at least 90-97% protection against the hepatitis A virus in most healthy adults and children who receive a complete series.

Hepatitis A vaccine provides about 80% protection against hepatitis A virus if given within a week of being exposed.

What is the schedule for the vaccine?

Two doses of the vaccine are needed for lasting protection. These doses should be given 6-36 months apart depending on the product. Hepatitis A vaccine may be given at the same time as other routine vaccine(s), but at a different site using a different needle.

Are there side effects with the vaccine?

The most common side effects are:

- soreness and redness where the shot was given
- headache
- irritability
- malaise
- fever
- fatigue
- gastrointestinal symptoms

Side effects are usually mild and only last a short time. A cold, wet compress applied to the injection site and/or acetaminophen can be used to help relieve pain, swelling and/or mild fever after vaccination.

Severe allergic reactions after vaccination are very rare and may not be related to the vaccine. However, if you think a serious reaction is developing, seek medical attention right away. Any unusual or significant changes in your health or your child's health after the immunization should be reported to a health care provider and the Health Department.

Who should not get the vaccine?

- Anyone who has had a serious allergic reaction (called anaphylaxis) to a previous dose of hepatitis A vaccine
- People who are sick with a high fever or serious infection worse than a cold should wait until they feel better before getting the vaccine
- If you have any medical conditions, discuss the vaccine with a healthcare provider to determine if you should receive it
- Any component in a vaccine may be a potential allergen. The most common for hepatitis A are:
 - Neomycin
 - Latex (Vaqta ® only)
- Pregnant or breastfeeding women should discuss the need for hepatitis A vaccine with their health care provider before vaccination.
